Over at the Single Drive website GM gave the dimensions for a Mass Loaded Transmission Line using Fostex 127e drivers. I cut the wood to try these dimensions out using 70 cent shelving. I did the cutting for this quite while back. I thought I made some boo boos and nothing fit. Other day I got the pieces out and dry fitted them again. It was like the elves fixed them. Who knew? Of all the places to put the port on an MLTL, the bottom seems to be the preferred place and adding some sort of chute to focus the sound. Any ideas on this? Sorry, no *pic*. I had the item saved but couldn't pull the website archive out of the whatever. Tried the Wayback machine too.
