I guess the only way I'll satisfy my questions as to how the FE206e's will sound in the Voight pipe design is to build them---I have a good plan in a 6" driver but could use some spec's for the 8 inch--I have talked to Brad (cabinet builder) about using some solid hardwoods over plys---we'll about that---anyone seen a 8" plan?? Jim

The only plan I have seen is at the link below. It seems to be about the same size as your current pipes. It uses the 207 instead of the 206. I have been considering building another set of Voigt pipes for my Audio Nirvana 8" drivers, whose T/S parameters are close to the 206. I will make them in a slightly larger cross section, dictated by the 11-1/4" width of the mdf boards I get from my lumber source. But hardwood would look really nice.

Well there is a major diffierence in Qts. Some added series resistance will help (4-6 ohms). Be sure to use at least 10 watt non inductive resistors. I had my original 206es in a break in, folded TQWT and it took the added series resistance to get an acceptable bass response.ron

If you must use series resistance I wounder if you could parallel the resistor with a 1.5mH inductor to create a baffle step compensation network?

Sorry, Fred. That won't work. The series resistor is just to raise the effective Qts of the driver up to the level needed for a Voigt Pipe. The BSC step filter comes after that. My personal dislike for the Voigt pipe is well known, particularly the Lowther Club of Norway TQWT that one of the links is really pointing at. But if you must, use the FE207E rather than the FE206E. You will have a much better chance as a decent sound. Bob

Hi Bob, I'm interested in hearing your opinion of Voigt Pipes. Do you have a link to it, or can you provide a 60 sec tour? thanks, gcl.

This link is what I discovered about the classic Voigt pipe, which BTW, is not what Paul Voigt had intended. But that's another story. GM points out, quite correctly, that the zero So pipe does have a use with certain drivers, but in general you must give up bass extension for mid-bass smoothness. The classic VP with extension below Fs is fatally flawed. Bob

if you're having a cabinet builder build it, why not just go for a back horn. Ron's design seems to be liked. Another interesting post I came across today on AA using the 206 E (though in a 2 way) at <http://www.audioasylum.com/forums/hug/messages/88224.html> cheers, nice meeting you a few weeks ago at GPAF.

Subject: Voigt Pipe Alternative for FE-206

The only advantage to a voigt pipe appears to be its simplicity - it's very easy to build one. In contrast, all the back loaded horn enclosure plans I have seen for the FE-166 and 206 would require some woodworking skills and seem to be very labor intensive. I was wondering if there's a simpler plan, possibly like the BK-16 folded horn that Madisound offers as a flat pack kit for \$98?
BK-16 Horn Enclosure

Can you shoot me an de-mail with rons back loaded horn plans---I'm not up on this design I guess
Jim

Dont believe i would ever make a pipe with an Fc below .707 Fs. And that is streaching it to the limit. I have done it in the past and lost a great amount of resolution in the LF response. Equal to , or better yet, 1.4 x Fs sounds better.ron

I have a pair of the Decware modified FE206's in a pair of Voigt pipes I built a several months ago based on the Lowther club plans and I think they sound great. I used 3/4" maple ply for the front, sides and base and select pine for the back with the drivers mounted on the vertical and a small angled piece added in the back at about 45 degrees towards the port, and some felt lining the bottom and angled piece. I really have been very satisfied with them. I have the K502 kit tube amp and recently added Voltseconds CCS mods and then triode strapped it, and the sound is much better in triode mode, it really matches well with the speakers. I also swapped out various speaker wire until I found one that seemed to have better bass. I am tempted to build a set of horns though

just to swap drivers and compare how they sound.
