Reading the links from Lowther America site has guys getting below 60 Hz from Martin Kings cabinets--lower than from the Medellion II which says it only goes down to 60Hz---makes a guy wonder!! and for comment: I think he was still using the Zobel circuit but not the one for Fostex 206's---any feedback??? Jim

Jim,I am getting down to 40 Hz with the Lowthers in my ML TL design. What links are you following? I am not aware of any info on the Lowther America site.Martin

Martin go to the Lowther America web site --then to links---one site is a lengthy story of builing Medellions and then building your BR design----and he reports of better low end than the Lowther design---but your comment as which driver is valid---a driver with more extension has better low Hz values but does so at the expense of the top end-and thsi is so for a driver that performs well on hi end will not have that low end punch---I'll reprot back as to which Lowthers I get and how I apply them Jim

Jim, The DX2 is also a very good driver. I am sure you won't be disappointed. I look forward to hearing your impressions of the DX2 in the different enclosure configurations. Martin
