Has anyone here had experience using 4 or 6 Fostex FE103E in a vertical array? They're only 4" diameter so I would think they would sound great in an array. The Fostex FE103E sounds so good in a backhorn or pipe that it seems like it would make an excellent array prospect, albeit maybe a little expensive. Something tells me it would be a real worthy candidate for the ultimate expression though. Opinions anyone?

I came close to building a Whamodyne with them about a year ago but had too many other projects going. I did buy Dayton woofers (instead of the MCM) to build the BP sub though. 95db efficiency for a pair of subs for \$60 seems great. These may wind up being paired with my new arrays. taylor
