---

I built a set of line array's using 20 Audax 3" APO8OGO full range drivers and 1 H26TG25-06 horn loaded tweeter per cabinet, The sound coming from them is nice, but I would like it to be much better. The cabinets are 5" wide, 8" deep (sides angled at about 15 degree's), & 72" tall open back. I plan to rebuild them using the same 20 3" Audax drivers and 4 PT2 plannar's from parts express. Any info that I could get would be great; Some one that will build the crossovers even if I already have the drivers Cabinet options I also would like some input on a center channel and 2 surrounds using the same drivers. I am a little slow on electronics, But I have a full wokshop with every woodworking tool available. I am running 2- MK2 12" sealed 2.4 cu.ft. subs for the low end. Thanks in advance for any info, Clyde
