Hi ... If I angle a focused array so the speaker is off axis for better speaker response the focal point (which is critical in focused arrays) will either be in front or behind the listening position. Can there be a balance of response to focal point? Sorry Jim I cannot make the panel flat. Zene

Hi Zene, My array loses the highs and the imaging as I move off the focus point. Are you using tweeters also? Perhaps you can have a shorter tweeter array that is in "nearfield" at the listening point. Any pics yet of your towers? Hope this helps..-Linc
