I am close to mounting the woofer drivers, and wiring them together in my line array.Does the quality of internal hook up wire between drivers matter? Doing a rough calculation, I need 70 ft of cable inside the array. Does anyone have an opinion on decent internal hook up wire? I have $50 to $75 USD for this step in the project. Should I get decent cable, or save the money and buy cheep wire?Tom R

Ordinary stranded speaker wire is fine. I would use 18 gauge minimum,but prefer 16 gauge. You can use bigger wire than that but make sureit's flexible to make the install easy and as long as it doesn't costalot.
