HI Everyone,I just bought a used monsoon audio mm1000 system for my computer. I bought it based on a strong recommendation from the audio critic magazine. The system consists of 2 planar speakers with neodymium magnets from 200 HZ plus, with an active sub, and an active crossover. The sub goes down to about 50 HZ. I have to say, this is a fantastic sounding system. It sounds a lot cleaner than my home system, (maybe the planar speakers are cleaner?), and while it lacks the soft lush sound, it sounds more accurate and cleaner. Overall, very very good! Anyone heard systems by monsoon (songstix is the parent company I think?)-akhilesh

It would be interesting for you to get together with Mark Margiotta and compare with his Magneplanars. I think the meeting after next might be at his place because he has a few new things to show. We could combine this to hear your new acquisition too. Next meeting will probably be at Wassilak's place, to showcase his arrays. But I think it would be interesting to hear the difference in the Monsoon and Magneplanar speakers, so maybe we could do that at the meeting after next. What do you think? By the way, how large are the Monsoon speakers?

HI Wayne, The monsoon planars are about 7 inches by 4 inches. They go up from 200 hz up. Below that is a sub, with an active crossover. A cheap little sub with cheap electronics, but decent. The whole system is available on ebay nowadays for about \$100. I am listening to it now, in my office. It is as good as anything I have heard, in its INTENDED listening env, which means, on a desk, with about 18 inches of reflective surface. I think the planars are engineered to make use of the reflective surface, to provide a clean signal to the listener. Sound is very clear, and clean. Imaging is great. Highs are very nice, and effortless. Bass is very adequate, surprisingly, given it is crossed at 200HZ. Imaging does not appear to be affected. Overall, very very satisfying. They also serve as a great reference for my home built speakers.....I now know for example that my home systems are pretty decent too, since they compare well to these "reference" computer audio system! BTW, I got the idea to buy them from reading their review in the audio critic, written a couple of years ago. Peter aczel said they sounded as good as any high end system, in their intended environment. He was right. The monsoon m1000 was designed by David Clark, who

apprently also does a lot of audio design for automotive environments, and knows how to take advantage of reflective surfaces. All i can reiterate is, these are darn good! -akhilesh

Very possible, Wayne. These are about 7 inches tall, which would be about a fifth of a meter. they are tiny (built for a desk) but handle 200HZ up with major aplomb. -akhilesh

Wayne,They do make other planar models. The company that makes them is called songistix. One can find monsoon planar speakers on audiogon. I think the home models are FPF models. -akhilesh

picked up a monsoon pm-14 computer sat-sub system last year on closeout at circuit city for \$60, .. excellent sound and built very well, .. and since that point my reference for what PC sound systems should sound like. i prefer it to the klipsch systems (expecially given what i paid for it)my one criticism would be the x-over point of 200Hz, .. which can result in localization of bass/midbass from the subwoofer if not placed somewhat equidistant between the sats.

I thought so. I thought songistix got their stuff from eminent....basically i read soemwhere there was a connection. Those speakers in your room sounded really good. I heard a lot of people say they were impressed by the clarity. I certainly was!Your cables were playing good stuff!-akhilesh
