Describe the radio and list the tubes it uses. Perhaps it has an OEM chassis, and a schematic can be found for it.

Hi Wayne. Both are wood, tabletop and same tube lineup: 6d6, 6c6, 43, 25z5. The 153 is bw/sw with a k55c ballast. the 194 is bw only with a k55b ballast. My problem is with the electrolytics. Both have unmarked rectangular paper multi-caps. The 153 has 7 wires; 3 black, 4 brown. The 194 multi-cap has been changed at some point as it has 6 leads with only 5 connected and the leads have been taped at mid-wire connections. I am new to old radios and don't want to try to guess at these values. The 194 is listed in Steins Tabletop Vol.1, p-48. Thanks for your response. Spencer CS

Power supply electrolytics can be made arbitrarily large. Most are only 20uF-50uF but pretty high voltage, usually 250v or 450v. You can swap them with polypropylene or electrolytic capacitors, the bigger the better.

Thanks a bunch Wayne. You mentioned OEM mfg's which I hadn't thought of. I went through a number of Riders and found maybe 50 different schem's using that lineup. I didn't find an exact match but several were close enough to give me an idea of values. I have tried to measure other multicaps after removing them but most were nowhere near the stated values. I'm learning.
Thanks. Spencer CS
