Hi! Does anybody have any any information on the construction techniques that RCA and Frazier used on their threater horns (e.g. RCA Ubangi)? I've seen a pict (<http://home.att.net/~lkalin/photogallery.html>) (Michael Christ) where it looks like he's reproducing the rigcage curve of some alien cow-being: elegant but not commercially viable. They must have had a relatively quick-and-dirty technique to build a commercial product. Any info deeply appreciated.

I don't know what specific fabrication techniques were used, but I suspect they may have been fully hand crafted in a job shop. What is cost prohibitive and impractical today was commonplace fifty years ago. Even a table radio from those days is incredibly labor-intensive by today's standards. Point-to-point wiring was replaced by printed circuit boards and pressed steel and injection molds replaced hand-made cabinetry. The cost of labor just makes hand assembly prohibitively expensive. In that spirit, the work of Michael Christ is incredible, isn't it?
