Hallo, Potentiometer on my vintage Sherwood SEL 400 (about 1973) integrated amplifier is broken, damaged-no way to repair. Potentiometer has three sections - two for stereo, plus one - last section for power on off switch. There is already loudness correction on the last 1/3 of full length. Nominal resistance is 50k Ohm, it is linear, otherwise dimensions are quite ordinary one. (There is already label on potentiometer with marks: CTS, Type TV-TCC) Bad news is that it is quite rarely to find such potentiometer these days in electronic shops. Almost impossible! I would really very appreciate every information or help to find that potentiometer. (my e-mail is: [peter.bergant@elektro-ljubljana.si](mailto:peter.bergant@elektro-ljubljana.si)) Best regards, Peter
