presence" control-which boosts the high frequencies. It accomplishes this not by actually boosting the highs in the forward path of the output circuit, rather by cutting the amount of high frequencies being fed back. Presence control- would cut the high frequency being fed back 1.) I want a Presence control in my guitar? how do i do it ? Presence uses Negative feedback ?" cuts the highs being fed back to it? My Goal is to add Presence in the guitar "Presence is different that a filter"Putting a preamp and taking the negativefeedback and putting a low pass and high pass Filter in the negative feedback path will give Presence and resonance controlsthats the active approach right?
