I own a Fender BXR 100 Combo bass amp which I bought used a year ago now. Its solid state...so I know tubes are not my problem. One day I was playing at no more than half volume and all of a sudden my sound faded out down to a dull thud. I tried turning it on and off and playing the volume, but nothing changed. So I asked a friend who is somewhat amp savvy what he thought it was, his advice was to replace the speaker. Three days later after not playing the amp I turned it on and tried it again....it played at normal volume for about 1 minute before fading out again. DO you think its a dead speaker? Or something more serious? Please help! Thank you

Probably something with power supply (diodes, caps...), but if you're not skilled enough to find it, then trip to the tech is in order...

More than likely bad power supply caps. Modern Fender amps seem to have a higher than normal capacitor failure rate. Another thing to check are the plastic input jacks. If the metal retainer ring has fallen out, the plug will move around and make/break contact.
