I thought I would throw this question out to all you Uberschall owners. I have a 2006 Revision Blue Uberschall , Whenever I pull my guitar cable out of the input jack I can hear a intermittent clicking sound coming from within the chassis,It will do it when amp is on and off standby, and only for a few seconds . It will stop immediately when I plug back into it , only when I unplug it. ,,I know ,, just don't unplug cable ..he he he .. The amp sounds great and there is no issues whatsoever with the amp , but this is kinda baffling me , ... Anybody else have this issue with your Uber ?? .. All opinions welcome ... Cheers
