Hey!!'m having some problems with my 8040. Recently I noticed that every 20 to 30 seconds or so, there is a big volume dip. It lasts for maybe 2 or 3 seconds, then the volume goes back to its normal level. I replaced the pre-amp tube but the problem didn't go away. Any ideas? thanks//rob

How does that socket look? You might clean all the contacts. If they get dirty or corroded it will make it do that.
