---

I have some older Event 20/20 Passive monitors. They sound fine when near a wall. However, out into the room on stands, I find the bass lacking a bit. Yes, I have subwoofers, but there is still a thinning out of the lower part of the male voice and upper bass. I was just thinking that MAYBE this ported design was deliberately tuned to be flat when near a wall. If so, could I just shorten up the port tube to get more mid bass. If so, how much might one shorten the port tube? The port tube is cardboard, easily cut. Any ideas?
