Anybody use them? Seems from looking into the interior of commercial speakers they're quite common. I understand the \$99 Franklin polyurethane gun is a disaster on wheels. Any other alternatives?

I use a commercial style hot melt gun for building crossover boards and holding down the components. Takes the 12" sticks. I don't see any point to the Franklin system unless you need some kind of weather resistant or water proof glueing system. Yellow glue holds hardwoods and plywood stronger than at the joint than the wood itself. MDF is only paper and you only have about .020 worth of bond and the paper breaks. I'm saying if the joint you get with the glue is stronger than the material and it's compatible to withstand the environment (your living room) Then the simple glue's are good enough. The one thin that could be exciting would be an "instant" bond. How much product is lost or wasted in the mixing tube of some of these systems could be a problem if you only need to apply a little every now and thenBillBill

"The one thin that could be exciting would be an "instant" bond"EXACTLY. I'm thinking this could help with stuff that's just too difficult to clamp and make things go a lot faster.

From the instant bond aspect it looks VERY interesting. The cost of the glue is incredibly costly. The polyurethanes I have used are really great glue too. I stopped using them because the mess

is a horror. I'm sorry but I refuse latex gloves for normal glue ups. Since this sets in as little a 30 seconds, maybe that problem is solved
