Hopefully, all my parts will be delivered in the next couple of weeks for me to start my next project, a CCS tube preamp. One thing about the building process that I have not figured out is how to label all the switches, knobs and jack in a professional looking manner. What's the best (and easiest) way to silkscreen or print on metal enclosures or wooden chassis? All my projects so far are unmarked and the only reason I can operate them is because I built them myself. But sometimes, even I get confused as to which jacks are input and which are output. Is this knob the volume or selector?thanks,Gar.

Subject: Maybe you could buy decals. (nt)

Decals are good, as Dean mentioned. You can also get what are called letter transfers, which are excellent for what you want to do. You rub them on and then protect them with a light shot of clear paint.

You mean like Letraset(R)? Wow, are they still around? Maybe the DIY communittee can single handedly bring the company back. Talking about a company being blind-sided by the boom of PC's. I remember they were so late getting into electronic fonts.I'll check out some art supply stores to see they still have anything like this around.Gar.

Yes, you can get these decals and letter transfers with the exact text you want. Check out these decals from Antique Electronics. They're water-release decals and they're recreations of vintage decals, but that's cool and may suit your needs just perfectly. It would give your project a neat vintage/retro feel. And some don't look retro at all, so there's a pretty good assortment in each package. Also check out Parts Express. They have letter transfers, specializing in specific industries like "audio" or "test equipment". Sheets are available in black or white. Here's a link. I still have a bunch of the Chart-Pak transfer sheets in various fonts, each with like 30 copies of the same letter. It's great for building prototypes, and I've used a bunch of 'em over the years. You can get that stuff at your favorite distributor, like Carlton-Bates or Hamilton-Avnet or whoever. But for one-off projects, I think the sheets from Antique Electronics and Parts Express are pretty handy.
