I saw this and thought Craftsman page was a good place for the reference. Origin was PE 3/23/04 [Last frame intentionally left blank... I guess] What is really needed is a crossover how-to... you know....from buying the parts to completion. Ed Dell at [_audioXpress_](#) is dependent on what his writers send him. But I made the suggestion that any xo information should be in three forms: schematic, placement and layout, finally a photograph. This is not very common but it's the only technique that makes sense to me.

Veneering technique for large boxes

Way too easy. I'll have to give it a try!

Glad it was useful to somebody and not widely in use already. BTW here is the best tip I ever got outside of being a cabdriver: If you have a screw that has the top worn off and you can't get it out with a screwdriver do not try to drill it out first. A method that was passed on to me was to file one of the screw sides flat and then the opposite side. This makes it a snap to get the screw loose and removed with a small pliers or other pinching tool. I encountered the initial problem with a 5.25 drive and couldn't sensibly drill in toward the mechanism. It's the best tip I know and I wouldn't have thought of it yet if somebody at [alt.fifty-plus.friends](#) didn't tell me about it. Save and share with my compliments.
