I've mentioned here and there how much I like PL400 for gluing up boxes and especially internal baffle parts. The Home Depot is now stocking a line of adhesive/caulks called SIKA. Their polyurethane construction adhesive is far more flexible when set than the PL product with an equally strong bond. They also showed an epoxy in a tube that ha a special nozzle where the mixing takes place so a $2 caulking gun gets it done. Dries to 6000 PSI strong in 20 minutes at 40 degrees. So maybe you have to frame a house while your waiting for the veneer to dry?
