OK, I'm not going to give an opinion for or against. Just the link. This gentleman is loading a subwoofer with audiophile grade rocks and selling them. You be the judges! jim...

I was so impressed by their marketing claims that I bought a few pounds and stuffed it into the ports of my Three Pi Theater speakers. There was an immediate improvement in the sound, even before the rocks had time to break in, but only when I used it along with the intelligent chip, the clever little clock, brilliant pebbles, and the tru-tone duplex cover. Oh, I forgot to mention, you also need to be wearing a magnetized ion bracelet when you insert the rocks. Amazing product!

Fred, did they also send a soft covered stone to set on top of your CDP? Seems that should be included.

If you don't set the brilliant pebbles on M'pingo wood disks then your speakers will immediately go out of phase; never to return.I had the intelligent chip for a while. Until I caught it ordering pizza in my name. Gave the chip to the dog. She fixed it's clock so to speak

The rocks didn't do a thing for me with I used them in speakers. However, after swallowing one, I found my hearing extending past 100kHz, and I was able to identify 93% of interconnects in market today in blind A/B 97% of the time.

does anyone actually know how well they're selling though?i'd thought any audiophile would know there're physics-based calculations on enclosure dimensions and the bass port.
