and I certainly don't want to throw a monkey wrench into the plans Doug. But if low(est) cost is an issue perhaps you might consider a standard off the wall 120 by 240 transformer. With todays higher line voltage and especially if it's oversized a bit I'd expect around 250-260VAC out. Into a choke say ~ 230VDC and into a cap ~ 350VDC with solid state diodes. Then get the Rat Shack heater transformer. Just an idea...too bad I didn't know about this idea earlier as I suppose it's a little late for such ideas.Russ

Hey Russ,The party, as I understand it, changed its view on low cost in order to get some extended flexability. Heating a 6.3V cathode with 5V is another option available too. The triple HV windigs offer L.C voltage from ~190 to 320 with a simple full wave. Other combinations on up to 800vac into a full bridge can be used as well.Besides, any ideas are welcome, and can be applied of they will merge well with the project.regards,Douglas

So; are we all Party Members? Sounds somewhat subversive.

doesn't sound so subversive to me. From a 'T' shirt I got at a Grateful Dead Show in Philadelphia. Presidential-style seal with a steal-your-face... I think it got sent to the rag bag in the sky after a botched oil change on my Diesel P/U.regards,Douglas

The party member thing; you know back in the day; Joe M'Carthy, 1950's, ohh never mind.Nice to know the spirit behind Guinevere links someway to the Dead. I saw them once in Ames, Iowa. They began to play Box of Rain; and it started to rain; later on they went into China Cat Sunflower

and at the Sun Will Shine Part; the sun came out. People on dangerous chemicals began to shout;"Jerry can control the wheather, man!"Sad to hear of the demise of the shirt.
