Guys; what are you all doing with your CCS. Are you shock mounting them to the chassis with bolts and nuts?Are you tieing the output wire's to the solder tabs then letting them hang?Are you glueing or taping the little perfboard squares to the underside of the chassis then wireing them into the circuit?Maybe using very short wires and tieing them to the tube pins like Bottlehead does?Which method is most appropriate for this application?Thanks; J.R.

I like to mount the boards next to the socket with a bit of quick setting epoxy. JB Wled Qwik Set works well. Clean the chassis. Carb cleaner is my fav. Don't breath too much ov it though...Short, solid core wires can work as a safetey feature in case the glue fails.regards,Douglas

I plan to stick mine down with a little Velcro, so I can lift it out to get to the pot's as needed...John
