
Subject: cathode followers: minimum input impedance configuration?

Hey-Hey!!!,I have built some linestages with cathode follower outputs. Straight triode, triode cascodes, and pentodes. I saw a description of a linestage using the type 85 tube. It was described as having a cascode 6BL7 output stage. The 85 is a high plate Z, low-ish mu triode. Seems that this output buffer would present a minimal load to its plate. How to manage the input capacitance? Will a screen grid have more capacitance to grid than the other options? Let me gues...depends on the screen grid....)cheers,Douglas

Are you still looking for an SCA 35?

Subject: well now...

I would always like to have more gear. The question is usually, where am I going to put it. Answering this with a low acquisition price makes squeezing another one in easier. Pentode at netscape Period comThanks for asking,Douglas
