I am looking for speaker-enclosure plans suitable for 15" EVM drivers. Front-loaded "scoop", or Carlson enclosures. (low freq. cabs for medium-sized "club" P.A.)

I have some plans for that size woofer, but each model was designed for a specific JBL or Eminence woofer. As such, they may or may not be suitable for use with yours. You might want to post this on the High Efficiency forum, where you're likely to get some good feedback. Lots of people that post there use EV drivers.

Wayne: I have seen this mentioned several times... what is the URL for the High Efficiency forum? Or how else may I link to it?
