Hi, I would like to build a speaker enclosure about the size of a average coffee table.(approx 7.5 cubic ft) Would it be ok to build it bigger than the recommended size for the speakers I want to use? I would like to get the lowest frequencies possible. I am thinking of using 2 15" speakers. Not sure if I want magnet to magnet, or cone to cone? What would give me more lower frequencies?

For that size cabinet, I'd suggest a pair of JBL 2235's or a single JBL 2245. Tune the box to 30Hz.

Thanks.. Just trying to get some ideas before buying any speakers or cutting any wood. Thanks again.
