Please help me because I have a problem. I have made speakers and the sound that they make is bad. The low range is too quiet. I assume that I did not have the correct formula for calculating the volume of the box. So please can anybody send me the correct formula for closed, vented or band pass box and explanation for that formula including units. Or help me to find some literature or program that works good.

Download the PiAlign and BoxPlot programs at the bottom of the page at the Pi Speakers website. Read the "readme.txt" file before using PiAlign and let us know if you have any trouble using either of these programs. These programs should help you determine what cabinet works best for your woofer.
