Hi,I'm trying and trying simulation for sound reinforcement sub-woofer enclosure. I do several simulation with a promising driver (18 inches), but I cannot decide in between a usual bass-reflex (about 120 Litres), or a 6th order band-pass speaker, with almost the same size. In theory, I got nearly 3dB more on the 50 to 100 Hz range (the range I'm interreset about) with the band pass, but is that reallity ? what about the sound ?? does it sound like a drum, or like a real speaker ?? I mean, does it have the bad habits of shifting the frequency near its hown resonance frequency ?? (I hear this on some PA system, and I really don't want something like this, sound like every bass notes are the really same)

Well bandpass boxes really can't compete with ported or sealed for sound quality... So it depends on what your priorities are. You really can't go wrong with a good old ported box, if you want slightly more output, not as decent a sound and a built in crossover (a crappy one, mind you), then go bandpass.Adam
