cheers gang, i sold my 7 pi's because they projected into the room like a pair of refrigerator's. my 4 pi's fit well but i want the soundstage a rear mounted driver provides. how close to the corner can i keep the speakers? if i want them tight can i use a smaller driver? is there a formula for corner horn loading? TILL E. and i must be the dumbest guy's on this forum. hey, i appreciate the help, if ever any of you freaks are in toronto, steaks and vino (and good tunes) are on me.cheersgeorge

But smart enough to be only 5 1/2 hours from my favorite North American city! After the get together in Lima with Mike, we'll convoy to Toronto, sleep on Replay's front yard and he'll grill steaks, eh?

provides 9dB DI all by itself. That's the same as a 70o conical horn with a square mouth. The nice thing about it is it is very simple to build and and doesn't require a delay on the mid/high horn to compensate for path length. Makes it extra soothing to listen to with steak and wine. [smile]
