The Pdf File is now on the JBL Tent sale site, see below link.I'm impressed, it goes all the way to 5k! with JBL's own traditionally very low distortion (between -30db and -25db @ 100W). Its about 99.5 db till 1k where it fluctuates between 100 and 102db before dropping off steeply at 4.5k (-5db@5k, -10db@6k).I might just order a few more, one of these and a high power piezo would make a killer guitar cab (so would four :-)).You can't often get a cast frame 300W 15" JBL for 50$ and free shipping.

Subject: Below Link, doh!

Yep..That's what I keep telling Freddy. I pulled the M-115's out of my 3677S's and replaced them with the 252's. With a 3rd order 2K xover they sound very smooth with a lot of slam and liveliness. $50.00 for cast frame JBL? Hell Yes! Buy More!!!

Subject: I did.

If my second order ever ships... I haven't got an email from them so it should eventually get here, I ordered 2 more just in case. :-)
