Is there such a thing as a Bandpass enclosure that's higher than 6th order. Maybe one with say three resonating chambers? Not exactly sure how one would do this, but has anybody? I was just looking into making a real big 6th order sub woofer using one of the M252's and stowing it under a pooltable. Some graphs of the response look pretty impressive.

Anytime you cascade filters - be they acoustic or electronic - you are creating a filter function having higher slope. There is an insertion loss and phase shift with each one, however.
