Hi, Getting started on building the boxes when I discovered the corners that these speakers will be placed in have baseboard heating running thru them. They're 8 inches high and extend out about 3.5 inches and impossible to move. Could I extend the front and first set of side panels(without changing the box dimensions) say 9-10 inches past where they meet the bottom panel? Would this gap have a negative impact on the sound? Or would some kind of solid base be more practical? Any suggestions would be most appreciated.Regards,Gerry Provenzale

I'm not sure what you are saying, but if it involves slight changes to cabinet proportions - keeping volume the same - it's probably OK. I'm more concerned with the cavity that might be under the floor - Do you have a raised hardwood floor? That's what really concerns me 'cause they can muddy the sound and be hard to deal with.
