Greetings all,I'm adding an 11' x 21' x 8' high sunroom on to my house. I'd like to put speakers at one end and was wondering about the combination of 7 pi cornerhorns and 20' of glass on one wall. Ceiling is broken up marginally by partially exposed beams, floor will be tile or stone over two layers of 3/4" ply.I have most of the components (Eminence) for a pair of 4 pis, which look a lot like the components for the 7 pi.Will the glass suck up enough bass to nullify the advantage of the cornerhorns?May I have the plans for the Theater and Stage 7 pi?Thanks very muchJohn

Your glass situation is one that sometimes causes problems and sometimes not, depending on the installation, I suppose. In most cases, large glass panels have proven to be OK, and the most cases are sliding glass doors and bay windows. But I've also seen them be a problem rattling. How do they react to your sound system now?

The glass isn't installed yet, but it'll be silicone-gasketed in place so it shouldn't (won't) rattle. The room dims seem OK for corner horns? I was concerned about standing waves with the length 2x the width.Also, NICE GOING on the "Shopping Cart"! Prices are good, and the one-stop shopping is right on. Couldn't find PI decals, though, how do I go about acquiring a couple of those?Thanks again for the plans.John
