Hello. I don't know if you are the person who moderates this forum or if you are actually the person behind these Pi speakers. Please forgive my not knowing. In any event I think you may be able to answer my question. I do not see the Impedances listed in the areas where you give the specs of the individual speakers. Have I missed something here? Are they all the same? I suspect I just can't find the right place to tell me. It is an important factor to me and I suspect many others. If you could help me out here I would appreciate it. Thank you.

impedance is not a terribly good indicator of the actual impedance of a motor. So impedance at resonance or "Zmax" is also shown, which is a critical determiner of performance on amplifiers having low damping factor like SET amps without negative feedback often have.

Thanks for responding Mr. Parham. I think you answered my questions, but I have one more. What is a piezoelectric? Actually I don't need to know much about it, just how does it effect the Impedence of the speaker as a whole? Does it have any resistance on it's own?

A piezoelectric device is one that uses a quartz crystal as a motor/generator. You can get exact specifications, including the impedance curve, at www.PiSpeakers.com/KSN1041.htm.

Mr. Parham, you seem to be a wealth of knowledge here at this forum. Congratulations to you for your knowledge and your willingness to share it with others. Thank you for your help to me.
