Hey guys, what is a good horn lense for the JBL 2426H operating down to 1 kHz? I'm considering the JBL 2370A but it is simply way too expensive. So any suggestions? It is a 1" bolt on and I'm using it down to 1kHz. Adam

Adam, I am now using a copy of the 2370A made by P Speakers, a lot of pro shops use this brand. I do not have a 2426H on it, but it sounds great with the PSD 2002. I would love to have some JBL's though. The only difference I could see was the die seems were a little rough at the back of the throat. I used a small piece of 240 grit sandpaper to smooth it out. Now you can't tell the difference between the two. (I inspected them with a 2370 at the shop I bought them at) I paid about \$82.00 each. Follow the link and you will see that they are dead ringers. Thomas

on ebay. They are in great shape, I hate to part with them, but.....I figure if they get around \$80-90n apiece I'll let 'em fly. MBB

2370A's

they are the least expensive of any of the brand names. Parts express also carries some no name lenses but so far everyone is still wondering and not tried them. The peavey is a screw on and cost more.bill

Hey, thanks Tom.Do you have a website or anything like that where I can examine these things? I believe your word, but I'm taking the CD's down to 1 kHz, whereas the 2002's are only down to 1.5. I have to make sure the lenses will handle this well.Also, are these the same flare type as the CH-3?Adam

I'd like to keep the flare frequency in the 600-800 Hz range. I have to run the unit down to 1,000 Hz. Adam

Sorry for the confusion. The driver is only going down to 1kHz, but I'd like to keep the flare lower than that.Adam

Adam,When I first got these things I mounted some Renkus Heinz Mid drivers to them to see how low they would go, and I can say they will make the bones in your ears click @ 800 Hz. I also got meaningful output from the psd 2002 @ 1000 Hz. I know I shouldn't have, but it was too tempting and easy with electronic x-over. 2002's sound lousy that low btw. It is a good clone of the 2370. Unfortunately the links below do not offer much info, but will allow you a source should you choose to try them. If you can see them at a shop next to a real JBL you will buy them. Without the logo I would not have been able to tell you the difference. The flare, support ribs, and all. I don't know how they got their dies, but they did an amazing job if they didn't steal them. I wonder if they have some kind of deal with JBL because they make replicas of most of their horns.Loudspeakers plus has a # you can call for technical info at the bottom of the page<http://www.loudspeakersplus.com/html/ph2370-specs.html><http://www.speakercity.com/paudio/HornIndex.shtml>
