Subject: Can I build my Studio One Pi using 3/4" MDF?

I'm wondering if it would work just as well using 3/4" instead of 5/8" MDF for the Studio One Pi cabinet. I can get 5/8" MDF but my friend who makes the pieces for me has some pieces of 19mm (3/4") laying around. I would of course recalculate the cabinet so that the internal size is exactly the same./Erik

The 3/4" would work better if anything, but I doubt you would notice much difference. I don't even think you have to worry about recalculating the box size, the difference would be negligible...Adam

Subject: Yes. Just make sure port length is right.

It will be just fine. But do make sure that your port is the right length. You want a tube that's 2.38" inside diameter and 3.5" long. Don't overlook the length of the baffle when installing the port. We want a tube that's 3.5" long from entrance to exit.

I found out that I'll have to buy MDF for this project anyway. So now I have the choice of going with any thickness. What do you recommend? Standard 5/8" would be 16mm with our metric

performing speaker, do I need bracing with the 16mm (5/8") MDF?/Erik

Either would be just fine. As I mentioned in my last reply, just be sure that the port is the right length and diameter. When using a thicker panel, there is more length of "duct" simply due to the depth of the port hole cut into it. So please be sure to consider this when making your port, and make sure it's total length is 89cm. On the matter of bracing, the box is small enough that it is pretty solid without braces. Certainly, you can't be too solid so it wouldn't hurt to use the thicker panels or to add bracing. So you won't hurt yourself to go bigger or to add braces.
