Hey Wayne, we are going to try with these cabinet dimensions: 49 inches high, 18inches wide and 18" deep. Will there be any problems with the baffle width baffle step compensation? Is 18" going to be wide enough for the front baffle? Thanks again!

As long as you keep them as close to a wall as you possibly can, this won't be an issue.I personally think baffle step compensation is unnecessary and shouldn't be hardwired into any speakers unless you know thye will always be run in half space.Keep them close to a wall and the effect should be negligable. None of Wayne's designs use a baffle step compensation circuit.Adam
