Well, does anybody have idea, in what enclosure I can put a 13cm driver with Qts=1.20, Vas=25 l, fs=80 Hz. This is driver 4 ohm intended to use in car. But, I don't use it, and my friend wants to build something active to play with PC audiocard. Is it possible with this driver? It seems to be a huge enclosure because of Qts=1.20 and still with big ripple...Anything to do?Thanks in advance

Need a big box all right.Jammed alignments per Keele:Butterworth B4 207l fb 27 f3 27Bessel BE4 172l fb 21 f3 33BW Inter Order IB3 168l fb 27 f3 29If I were determined to use the driver I would go with the BE4. Biggest problem is going to be the plus 3db peak around 100 hz. But, if you like your sound a little fat, this would work.Dan
