I was not sure whether the Delta 12LF would go high enough to beused with the KSN 1038 tweeter using no cross over. Well I bought theparts and put them in a pair of floor monitors boxes. The sound isamazing. I like it almost better than the 2pi studio. There seems tobe less of a 'shout' in the midrange. A look in the Eminence sensitivitycharts gives the explanation. The Delta 12LF rolls off soonerthan the Alpha 10 so it integrates with the KSN1038 much bettersince there is almost no overlapping of frequency response. I was afraid that there would be a hole in the response at around 4k, butthere does not seem to be any. The floor monitor is only a 1 cubicfoot box, so the bass suffered, but not that much. In room response starts to roll off around 70Hz. These will have excellent bass ifthe box is the size of the Theater 3pi or about 3 cubic feet.The KSN 1038 high end is not as good as the PSD2002 so these cannotmatch the Theater 3pi but for $160 a pair (not counting the wood) since I already have the boxes, the price/performance ratio isexcellent.

Subject: Thanks Wayne

installed the 0.5mH coil on your Alpha 10's? New (silver label) model woofers need them, and they are really improved by the use of this coil. Also, have you tried the new Tower two's?I think you'll like those two options as well.
