As amazing as it sounds, its TRUE! I bought a JVC RX-8020VBK surroundreceiver ('cause I wanted it for the bedroom). Its rated at 120W/chrms, .08% distortion, 20-20KHz (stereo), 100W/ch x 5, at 1Khz. Onthe back of the unit, its rated at 320W/440VA input. According tomy calculations, I can produce extra, free, 180W just by running this thing full out! Amazing!On the good side, it works great with my 2Pi's as the fronts. No ideahow much signal tweaking is going on behind my back, but it soundsgood anyway. At least it has an "analog direct" button that removesall that junk, and that mode does sound much better to me.Just a heads up...

Five channel output of 100 watts per. And input requirements of 320 watts. Pretty cool, you're right! Anyway, glad it sounds good.
