I'm looking at the 2pi and 3pi for a small SET amp. Are the xovers for these speakers an easy load? Which model would be the best overall value for a long-term, keep speaker? Thanks.

What you want is as nearly a purely resistive load as possible. You don't want large changes in impedance, and the highest peak is usually in the bass resonance region. But certain crossover

resonance of the Professional Series is a little higher than what I generally recommend for SET amps, some of 'em do just fine with these speakers. If your amp is one that isn't terribly sensitive

2 watt SET amps, and I'm absolutely loving it.
