I'd suggest the Eminence H290 or Bill Martinelli's 12" wood horn. Another great option is Martinelli's 17" horn. Since it's a little larger, it can be used at a lower frequency. It will work just

the same.

Thanks Wayne,Is there any plan for Martinelli 17" horn ? I also looked at this interesting site: http://vincent.brient.free.fr/pav_ronds.htmdescribing relatively easy way to construct round horn...looksinteresting. Another Q: how important is sonic difference between stock eminenceplastic horn and good dessigned wood horn ?thanks, v

Bill Martinelli has step-by-step instructions how to build his horns at www.WoodHorn.com/Horn.htm. I think he'll sell the lathed billet aluminum throat by itself if you have woodworking skills and want to make the rest of the horn yourself. If you've got a machine

shop for the throat section, you won't need that. But if not, I'd contact him - Having a metal mounting plate for the driver is a big plus. It's got an O-ring to ensure a good seal with the driver and since the mounting plate is metal, it won't wear out and chip when installing and removing compression drivers like horns with a wood plate might.

There are step-by-step instructions on his site (woodhorn.com) showing how he builds them. If you're highly skilled and have the right gear, have at it. Having read through the DIY page, I'd rather let the master craftsman do it. But that's just me. Keep your ears and your mind open.

Subject: thanks
