Hi Wayne,   I've been thinking about your corner horn design, and theone thing that's been bugging me is that as designed, the soundwaves are being focused into a corner, then reflecting past eachother to be sent into the room around the sides of the cabinet.Can you comment on placing a wedge in the corner as a reflector?I've attempted a top view ascii version below. Assume everythingis at 45/90 degrees and the point of the wedge would be againstthe baffle board.Thx, Chris   /\   / \   / \   /\ /\   / \ / \   / \/ \

What you have to do is hard-code all of the spacing. Or include a line-art drawing of your idea. I suggest GIMP.Put the image file somewhere that Apache can find it, and stick it in your post.Peace,--Shannon

This wedge is a good idea, but surprisingly, you'll find that it doesn't make a noticeable difference. I used this exact sort of reflector in early prototypes and for the same reason you suggested - It would appear to direct on-axis sounds better. But I found no difference when I installed such a wedge.Check out John Sheerin's wave mapping animation. It shows the movement of a wavefront past reflectors such as these.
