Hi there,i have 2 JBL 2226H in parallel and a JBL 2450J loading a JBL 2360.Is it possible to drive this combination as a two-way or is it better to use a HF-driver like the JHL 2405?Is for a two-way the SL-diaphragm better?Is it possible to compensate the HF-roll-off of the 2450/2360 combo?If yes, can you send me a schematic of the crossover?Thank you for the answers.Dieter

schematics. However, if I were planning to use a pair of 2226's, I'd suggest that you modify this arrangement somewhat, having one of the woofers crossed over at a lower frequency so that only one of them is operating in the midrange.
