Hi all,The distributed sub concept that Audiokinesis, Pi and Gedlee like to use seems like a great idea to me. Smooth bass and potentially high WAF. There's only one thing that would make it even better:Wireless plate ampsDoes anyone know where something like that could be found or if it's even available? Seems like with wireless microphones being around there should be something like that to send the signal to the subs.Thanks in advance for any information,Eli

That does look like a fantastic subwoofer. Glad to see wireless subs coming about. For me though, I already have subs and just want to add a plate amp without having to run wires.I saw one online but it looked like it was a proof of concept because there was no ordering information. I also found wireless distribution products and they could certainly be added to plate amps to do the job. I was just hoping to find a nice subwoofer plate amp with a wireless receiver built in, bundled with a transmitter to connect to the sub channel output.Eli
