Wayne, could I have a look at your pi one plans using jbl professional components. Thanks in advance.

contained the JBL 2115J if you'd like. I'd be happy to scan the file and E-Mail it to you. The cabinet was aligned as per PiAlign, and so the cabinet is small - 0.66ft³ as I recall - and the port had to be mounted diagonally to fit in the box. For different applications, I also installed 2115's in 1ft³ and 2ft³ cabinets with good results. Each of these cabinets was tuned to approximately 45Hz.

Thanks Wayne. I'd like to use the larger cabinets tuned to 45Hz. I also wanted to see the crossover used with the 2405's.

Connect the 2405H using a second-order network having a 2.0uF cap in series and 0.5mH coil in shunt followed by an attenuator of 8 ohms in series and 4 ohms directly across the tweeter. For the 2115H, use a 0.5mH coil in series. If you run a 2115J, then use a 1.0mH coil instead.
