Final Remarks. The port hole is 7" - I couldn't find any port tubes that size but I'd still like to clean up the view into the port hole. The woofer: Bill E had a Delta Pro in there - it doesn't orient in any particular way like the Kilomax - so the woofer will forever be crooked as I'm too lazy(read:I've spent too much time on this project already) to go to all the trouble of drilling new holes, filling the existing, etc.Thanks again everyone - Bill E(original cabs), Ron(stockpiler of all things audio), Wayne(all the emails with Boxplots etc to fit the premium stage into the theatre 4 pi plans), Brian(delivered them to Toronto for me)regardsCraig.ps. I've yet to hook it up as I'm still finishing the second one and have yet to start my centre channel speaker.

Those look really great. I'll bet they sound great too!You might use a grill cloth or mesh to cover the bottom section with the port and woofer. Or maybe just stretch acoustically transparent grill cloth or foam over the port hole. Some people paint the insulation black immediately behind the port, which is a good look too.I'd probably be one of those that painted the inside of the cabinet near the port flat black. To me, that's a great look, and it would probably work well with your black leather finish.
