I have a set of drivers I can use either in Bass Reflex (3 pi) or a conerhorn (six pi). My low-mid frequency is a fostex FW300. The TS parameters can be seen in this link.<http://www.fostex.co.jp/int/pages/sets/prodset.html> If with a BR will probably use a fostex ft 17h to take care of the highs. If with the cornerhorn will use a fostex horn [with a 1" compression driver].FWIW the reoom is 15 x 17 ft. And this will be driven by an 8w 300B.

From the datasheets, it would appear to me that the FW305 would work very well in either a three model is that placement is not as critical, so the speaker can be used in more environments. But the cornerhorn has some properties that make it perform better, giving better bass response and a try if I had two good corners. The rising response of the FW305 will make it work pretty well in a two-way configuration, which makes the loudspeaker very attractive since there are no exposed drivers. The tweeter is forward facing, but when mounted on a wood horn, becomes an configuration too. Or you can run the system in a more conventional three-way configuration, and use something like one of the Fostex full-range drivers and a super-tweeter mounted in the front baffle. Looks to me like either of these approaches would be very promising.

Thanks again Wayne. I am thinking of doing this first before the altec 406s. I do agree and am tempted to really do the cornerhorns. But because of space limitations [the room is pretty full of furniture and is not really a dedicated listening room] I may have to settle with the 3 pi. Before I ask for the plans I will see if stuff can be moved about and free up some space for the cornerhorns.
