150Hz in a corner, 250Hz if not.

Sounds good, it could then even connect to a corner loaded lab horn if anyone wishes. However an all-horn version of the audiophile pi-seven corner horn would be an absolute killer i'm sure --- and loud too !cheersandreas

This looks really cool. What are the external dimensions?

The midhorn is 24" wide, 12" tall and 20" deep (including the driver). I'm still working on the eight

300Hz to 600Hz range and then crossover to a midrange. I found that they can be used much higher, and they sound great and look great too. Makes the system less complex. But there are benefits in having a dedicated midrange, and this one works well and looks good. It's a great medium-size vocal range horn.

Putting the horn in a corner room position is 1/8th space and will allow the horn to be used at a lower frequency. Free standing or only backed by a wall and floor the horn will rely on the mouth size more. Generally speaking Bill

Boundary loading tends to make a horn act like it's larger.

I'm really intrigued by the 8pi. I built the 2pi towers and I really like them, but it would be neat to try out the Alpha 10s like this. How would the crossover vary from the tower if one were to use the PSD 2002 with the Alpha in the 8pi? Or would you recommend a different tweeter?

I'm planning to use the PSD2002.

Speakers Crossover Compensation Values I'm quite sure you'd want to cross it at 1.6KHz if using the PSD2002. You could leave out the woofer crossover components and use their upper acoustic rolloff as the xover slope, I've been told.
