So- I built one of the mid horns, using 3/4 ply, a 12X12X10 rear chamber, using one of my peavey scorpion 10", and it plays very well, indeed. Very nice and smooth. Now for some integration questions- If I stack two vertical, I get: Better pattern control (increased directivity) 3 to 6 db more output lower cutoff freq...right? So I'm going to try a 2" EV driver, on a big ol HP940 horn, two stacked mid horns, and possibly a 4Pi cabinet/woofer for the bottom. Now thats looking like nice PA stacks to me...Larry Acklin

Sounds like a great plan. I really like the sound of these midhorns crossed to compression horns. You're right about the benefits of stacking. In fact, in freespace, you would really want to

Cool, have you got any pictures and measured response curves to share?
